①

## String Manipulation

lec 6

⇒ `print("Hello World \n Hello world")`

Output:-

Hello world  
Hello world

adds newline

`print("Hello" + "Jenny")`

output:-

HelloJenny

Concatenation of 2 strings using + symbol

`print("Hello" + " " + "Jenny")` → Hello Jenny

↳ it will print Hello Jenny with space in between

So using + symbol we can concatenate strings in Python

NOTE:- if we put a space or a tab before ~~start~~ writing print function then it will give "indentation error"

→ So in python we have to start writing our code at the beginning of the line.

Assignment:-

String Concatenation Exercise

String Concatenation is done with the "+" sign

e.g. `print("Hello" + "Jenny")`

New lines can be created with a backslash and n

There are more ~~no~~ ways to concatenate strings but those we will discuss in later videos.
